

Capability statement

Software, artificial intelligence, quality engineering
and cloud platforms - delivered to production.

The company

Ryvan Technologies is a specialist software and artificial-intelligence engineering company headquartered in Hyderabad, India. We design, develop, test and operate custom applications, intelligent systems and cloud platforms for organisations that require a single, accountable partner. We are a studio, not a staffing bench: the people who discuss the requirement remain involved in architecture, delivery and support.

Motto: Engineering intelligence into everything. Client names are published only with written consent. A non-disclosure agreement is signed before we review your systems.

Services

01 AI and intelligent automation

Private and on-premises language-model applications, retrieval-augmented generation, conversational operations assistants, workflow automation and computer vision. Systems are evaluated, access-controlled and supported after launch.

02 Custom software engineering

Web and mobile products, SaaS platforms, internal operations systems, ERP and CRM, APIs and integration. Taken from architecture and user experience through to production release.

03 Quality engineering

Automated end-to-end and API suites, quality gates in continuous integration, performance assessment and regression packs maintained as the product evolves.

04 Cloud and platform engineering

Cloud and Kubernetes platforms, CI/CD, identity and access, observability, and data platforms with a defined rollback path.

How an organisation begins

- Introductory discussion, without charge or obligation.
- Non-disclosure agreement if existing systems or data must be reviewed.
- Written proposal for a time-boxed discovery or a defined pilot.
- Delivery engagement once scope, timeline and responsibilities are agreed.

Delivery, once scope is agreed

- Discover - objectives, users, systems and constraints before technology is selected.
- Architect - scope, security, integrations and a phased plan in writing.
- Build - short iterations, working software reviewed, testing continuous.
- Validate - automated checks, security review and performance prior to release.
- Launch - production deployment with CI/CD, monitoring and rollback.
- Support - operations, optimisation and planned evolution after go-live.

Confidentiality and information security

- NDA before access to code, infrastructure or personal data.
- Least-privilege access, revoked at the end of the engagement.
- Work in your repository, cloud or on-premises environment when required.
- Client data is not used to train models unless contracted in writing.
- We complete reasonable vendor and security questionnaires. We do not claim ISO 27001 or SOC 2 certification we do not hold.
